Part Exchange (ticker: PXP) The Part Exchange Program was launched in 1982 by the Autodesk division of UGS Corp. The Part Exchange Program allows third parties to access or develop new features or functionality in AutoCAD or any other Autodesk software by releasing source code to a Development Center and receiving a royalty for the program's usage. Use in the entertainment industry Since AutoCAD's inception it has been a favored tool in the film, television, animation, game, architecture, and visual effects industries for designing models and animation. The first use in film was based on the molding technology that the Soviet Union used. In the Soviet Union they used a technique of using ABS (acrylonitrile butadiene styrene) plastic, which they put into a mold and then used paint, or ink, to replicate its silhouette. The American film industry soon adopted this technique of masking off a 3D model of a logo and then painting that on to the new model of an object. This was not a difficult method because the computer tools were very primitive. In the mid to late 1990s, the introduction of 3D scanners, scanners and software such as PhotoModeler, allowed for a rapid advancement in 3D graphics and models, which eventually led to the production of 3D CG. AutoCAD, along with other 3D modeling software, has also been used by the animation and film industry to design props for films, games, television programs, and other projects. AutoCAD's speed and capabilities make it ideal for the creation of 3D models, not only for the CGI industry, but for design and engineering as well. Although these programs have traditionally been used by the computer graphics industry, Autodesk saw the ability to use the software in other areas, like 3D modeling of vehicles and other commercial applications such as architecture, construction, and other fields of engineering. The use of Autodesk's 3D CAD and animation software has become increasingly prevalent and is used in many different fields, including television, film, architecture, engineering, game development, and visual effects. Some of the more popular applications of the software are AutoCAD, 3ds Max, Maya, and Softimage. For television and film production, computer-generated imagery (CGI) has become very important. Because of this, Autodesk has been able to acquire a number of Hollywood studios in the past. Some of these include Tri 5b5f913d15
